

WISE

Wise Network™

Powering IoT & M2M Economy with a Powerful Blockchain Integration

White paper

What is Wise Network and what is the opportunity for investors?

- WSE Token is expected to have a total market reach of \$1,567B by the year 2025

Wise Network is part of GBT TECHNOLOGIES, a Company Conglomerate valued by Deloitte at \$1 Billion (Currently undergoing this process)

- WSE Token will be listed on top exchanges, some of them being LATOKEN, OKEx, Houbi, BitMEX, BINANCE and our own GENESIS EXCHANGE.

- WSE Smart Contract has one of the highest scores in the industry (94.93% out of the 95% industry standard) after being audited by one of the top 2 companies in the market: HOSHO

Overview

Based out of Costa Rica, wise is an innovative developer of analog-mixed-signal, system-on-a-chip who created an ecosystem that enables a universe of applications on IoT and mobile devices using distributed ledger technology while backed by integrated-circuit-product-development. Tap into this ecosystem by acquiring our ERC 20 token.

Products

WISE presents: "ANSUZ" a Secure Memory Chip:

ANSUZ Chip can use Wi-Fi or Cellular networks to communicate with other ANSUZ chips. In addition, the microchip can communicate via its own radio waves in a wide variety of frequencies and in locations where there are no cellular or Wi-Fi services. This feature opens an entire world of IoT and network possibilities for remote locations. Each Wise device has a multi-layered security circuitry that is embedded within ANSUZ called wEYE. Our multi-layered security system provides: Connectivity protection, network protection, ECU protection and deterministic security.

WNet Protocol:

Each Wise (with ANSUZ SMC installed) device invests "listening" time in order to participate in the mesh. Unlike a typical mesh where all components are constantly on, the Wise mesh works with the WiseNET™ smart - timing protocol. This protocol, supervised by an artificial intelligence system is most of the time "sleeping" in order to conserve power. On certain intervals the system wakes up, "listens" and participates in mesh network activities in order to maintain full coverage at all times. Each onboard chip's AI system manages the time division operation.
